

# Rational homotopy type of the moduli space of stable rational curves

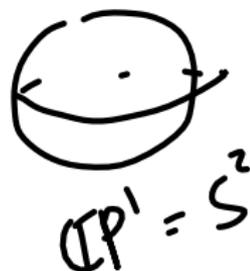

Vladimir Dotsenko (Université de Strasbourg)

April 7, 2022

## Motivation

/  $\mathbb{C}$

For each  $n \geq 3$ , one can define  $\overline{\mathcal{M}}_{0,n}$  the Deligne–Mumford compactification of the moduli space  $\mathcal{M}_{0,n}$  of smooth rational curves with  $n$  distinct marked points labelled  $1, \dots, n$ .

## Motivation

For each  $n \geq 3$ , one can define  $\overline{\mathcal{M}}_{0,n}$ , the Deligne–Mumford compactification of the moduli space  $\mathcal{M}_{0,n}$  of smooth rational curves with  $n$  distinct marked points labelled  $1, \dots, n$ .

Compactification means that we allow limits of smooth curves which are a little bit singular, but only the simplest possible singularities (simple nodes) are allowed.

## Motivation

For each  $n \geq 3$ , one can define  $\overline{\mathcal{M}}_{0,n}$ , the Deligne–Mumford compactification of the moduli space  $\mathcal{M}_{0,n}$  of smooth rational curves with  $n$  distinct marked points labelled  $1, \dots, n$ .

Compactification means that we allow limits of smooth curves which are a little bit singular, but only the simplest possible singularities (simple nodes) are allowed.

$\overline{\mathcal{M}}_{0,n}$  turns out to be a smooth projective variety, and moreover the cycle map from the Chow ring to the cohomology is an isomorphism. The Chow ring admits an elegant description: it is a commutative ring generated by divisors describing two-component singular curves, subject to linear and quadratic relations (Keel 1990).

## Motivation

For each  $n \geq 3$ , one can define  $\overline{\mathcal{M}}_{0,n}$ , the Deligne–Mumford compactification of the moduli space  $\mathcal{M}_{0,n}$  of smooth rational curves with  $n$  distinct marked points labelled  $1, \dots, n$ .

Compactification means that we allow limits of smooth curves which are a little bit singular, but only the simplest possible singularities (simple nodes) are allowed.

$\overline{\mathcal{M}}_{0,n}$  turns out to be a smooth projective variety, and moreover the cycle map from the Chow ring to the cohomology is an isomorphism. The Chow ring admits an elegant description: it is a commutative ring generated by divisors describing two-component singular curves, subject to linear and quadratic relations (Keel 1990).

Manin asked in early 2000s if the Chow rings of  $\overline{\mathcal{M}}_{0,n}$  were Koszul. Surprisingly, this question remained unsolved for about 15 years. In this talk, I shall give a positive solution, and discuss some related topics.

## Motivation

For each  $n \geq 3$ , one can define  $\overline{\mathcal{M}}_{0,n}$ , the Deligne–Mumford compactification of the moduli space  $\mathcal{M}_{0,n}$  of smooth rational curves with  $n$  distinct marked points labelled  $1, \dots, n$ .

Compactification means that we allow limits of smooth curves which are a little bit singular, but only the simplest possible singularities (simple nodes) are allowed.

$\overline{\mathcal{M}}_{0,n}$  turns out to be a smooth projective variety, and moreover the cycle map from the Chow ring to the cohomology is an isomorphism. The Chow ring admits an elegant description: it is a commutative ring generated by divisors describing two-component singular curves, subject to linear and quadratic relations (Keel 1990).

Manin asked in early 2000s if the Chow rings of  $\overline{\mathcal{M}}_{0,n}$  were Koszul. Surprisingly, this question remained unsolved for about 15 years. In this talk, I shall give a positive solution, and discuss some related topics. Convention: will use  $\overline{\mathcal{M}}_{0,1+n}$ , and label the points  $0, \dots, n$ .

## Recollections: Koszul algebras $\mathbb{k}$ a field

Let  $A$  be a weight graded (commutative or noncommutative) associative  $\mathbb{k}$ -algebra. We assume the weight grading to be *standard*, in other words, we assume  $A$  to be generated by elements of weight 1 (in particular,  $A_0 = \mathbb{k}$ ). Such an algebra is automatically augmented, and  $\mathbb{k}$  acquires a trivial  $A$ -module structure via the augmentation map.

## Recollections: Koszul algebras

Let  $A$  be a weight graded (commutative or noncommutative) associative  $\mathbb{k}$ -algebra. We assume the weight grading to be *standard*, in other words, we assume  $A$  to be generated by elements of weight 1 (in particular,  $A_0 = \mathbb{k}$ ). Such an algebra is automatically augmented, and  $\mathbb{k}$  acquires a trivial  $A$ -module structure via the augmentation map.

The algebra  $A$  is said to be *Koszul* if the trivial module has a resolution by free  $A$ -modules

$$\dots \rightarrow A^{a_n} \xrightarrow{d_n} A^{a_{n-1}} \xrightarrow{d_{n-1}} \dots \xrightarrow{d_2} A^{a_1} \xrightarrow{d_1} A \xrightarrow{\epsilon} \mathbb{k} \rightarrow 0,$$

where the differentials  $d_k$  are “linear”, i.e. their matrices consist of elements of weight 1. (This resolution can be used, among other things, to relate the derived category of  $A$ -modules to that of  $\text{Ext}^\bullet(\mathbb{k}, \mathbb{k})$ .)

## Recollections: Koszul algebras

Let  $A$  be a weight graded (commutative or noncommutative) associative  $\mathbb{k}$ -algebra. We assume the weight grading to be *standard*, in other words, we assume  $A$  to be generated by elements of weight 1 (in particular,  $A_0 = \mathbb{k}$ ). Such an algebra is automatically augmented, and  $\mathbb{k}$  acquires a trivial  $A$ -module structure via the augmentation map.

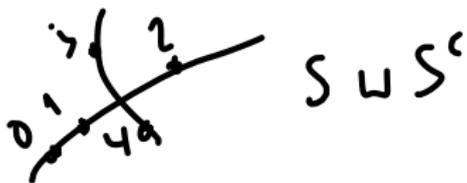

The algebra  $A$  is said to be *Koszul* if the trivial module has a resolution by free  $A$ -modules

$$\dots \rightarrow A^{a_n} \xrightarrow{d_n} A^{a_{n-1}} \xrightarrow{d_{n-1}} \dots \xrightarrow{d_2} A^{a_1} \xrightarrow{d_1} A \xrightarrow{\epsilon} \mathbb{k} \rightarrow 0,$$

where the differentials  $d_k$  are “linear”, i.e. their matrices consist of elements of weight 1. (This resolution can be used, among other things, to relate the derived category of  $A$ -modules to that of  $\text{Ext}^\bullet(\mathbb{k}, \mathbb{k})$ .)

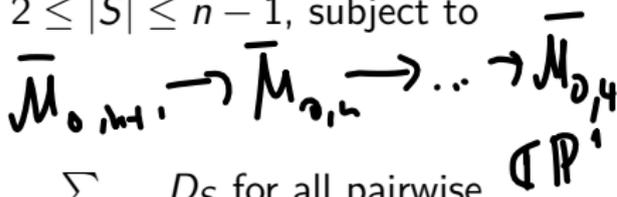

A Koszul algebra is necessarily quadratic, but the converse is not true. However, an algebra with a quadratic Gröbner basis is Koszul.

# Recollections: Keel presentation

Keel established that the Chow ring of  $\overline{\mathcal{M}}_{0,1+n}$  is generated by elements  $D_S$  with  $S \subset \{0, 1, \dots, n\}$ ,  $2 \leq |S| \leq n-1$ , subject to the relations

- $D_S = D_{S^c}$  for all  $S$ ,
- $\sum_{i,j \in S, k,l \notin S} D_S = \sum_{i,k \in S, j,l \notin S} D_S = \sum_{i,l \in S, j,k \notin S} D_S$  for all pairwise distinct  $i, j, k, l, k \in \{0, \dots, n\}$
- $D_S D_T = 0$  for all  $S, T$  with  $S \cap T \neq \emptyset$ ,  $S \not\subseteq T$ ,  $T \not\subseteq S$ ,  $S \subseteq T^c$ ,  $T \subseteq S^c$

Geometrically, the class  $D_S$  correspond to the divisor  $D^S$  whose generic element is the curve with two components, the points of  $S$  on one branch, the points of the complement  $S^c$  on the other.

## Recollections: De Concini–Procesi presentation

De Concini and Procesi established that  $\overline{\mathcal{M}}_{0,1+n}$  may be constructed as the wonderful compactification of the Coxeter arrangement of type  $A_{n-1}$  for the minimal building set. This leads to another presentation of the Chow ring:

## Recollections: De Concini–Procesi presentation

De Concini and Procesi established that  $\overline{\mathcal{M}}_{0,1+n}$  may be constructed as the wonderful compactification of the Coxeter arrangement of type  $A_{n-1}$  for the minimal building set. This leads to another presentation of the Chow ring:

the generators are  $Y_S$  with  $S \subseteq \{1, \dots, n\}$ ,  $2 \leq |S| \leq n$  and the relations between them are

- $\sum_{i,j \in S} Y_S = 0$  for all  $i \neq j$ ,
- $Y_S Y_T = 0$  for all  $S, T$  with  $S \cap T \neq \emptyset$ ,  $S \not\subseteq T$ ,  $T \not\subseteq S$ .

## Recollections: De Concini–Procesi presentation

De Concini and Procesi established that  $\overline{\mathcal{M}}_{0,1+n}$  may be constructed as the wonderful compactification of the Coxeter arrangement of type  $A_{n-1}$  for the minimal building set. This leads to another presentation of the Chow ring:

the generators are  $Y_S$  with  $S \subseteq \{1, \dots, n\}$ ,  $2 \leq |S| \leq n$ , and the relations between them are

- $\sum_{i,j \in S} Y_S = 0$  for all  $i \neq j$ ,
- $Y_S Y_T = 0$  for all  $S, T$  with  $S \cap T \neq \emptyset$ ,  $S \not\subseteq T$ ,  $T \not\subseteq S$ .

It is easy to see that if one eliminates  $D_S$  for  $0 \in S$  using the symmetry relation  $D_S = D_{S^c}$ , and also eliminates  $Y_{\{1, \dots, n\}}$  from the De Concini–Procesi presentation, the two presentations become identical.

## Need another presentation

order of monomials

$$\text{rels: } \underline{m} = \sum_{m' < m} c_{m, m'} m'$$

**Proposition.** Neither the Keel presentation nor the De Concini–Procesi presentation admits a linear-and-quadratic Gröbner basis (either commutative or noncommutative) for  $n \geq 4$ , no matter what admissible ordering of generators one chooses.

## Need another presentation

**Proposition.** Neither the Keel presentation nor the De Concini–Procesi presentation admits a linear-and-quadratic Gröbner basis (either commutative or noncommutative) for  $n \geq 4$ , no matter what admissible ordering of generators one chooses.

*Idea of the proof.* Let us discuss the Keel presentation. Suppose that there exists a linear-and-quadratic Gröbner basis, which we may assume reduced. The Chow ring is of finite rank, so the monomials  $D_S^k$ ,  $k \geq 1$ , cannot be all linearly independent, so for each  $S$ , either  $D_S$  or  $D_S^2$  appears as the leading monomial in our Gröbner basis.

## Need another presentation

**Proposition.** Neither the Keel presentation nor the De Concini–Procesi presentation admits a linear-and-quadratic Gröbner basis (either commutative or noncommutative) for  $n \geq 4$ , no matter what admissible ordering of generators one chooses.

*Idea of the proof.* Let us discuss the Keel presentation. Suppose that there exists a linear-and-quadratic Gröbner basis, which we may assume reduced. The Chow ring is of finite rank, so the monomials  $D_S^k$ ,  $k \geq 1$ , cannot be all linearly independent, so for each  $S$ , either  $D_S$  or  $D_S^2$  appears as the leading monomial in our Gröbner basis. Let us consider the smallest variable  $D_S$  which does not appear as a leading monomial (i.e. the smallest variable that is not eliminated). This means that  $D_S^2$  appears as a leading monomial; moreover, since the Gröbner basis we consider is assumed reduced, this means that  $D_S^2$  is a relation.

$$D_S^2 = 0$$

## Need another presentation

**Proposition.** Neither the Keel presentation nor the De Concini–Procesi presentation admits a linear-and-quadratic Gröbner basis (either commutative or noncommutative) for  $n \geq 4$ , no matter what admissible ordering of generators one chooses.

*Idea of the proof.* Let us discuss the Keel presentation. Suppose that there exists a linear-and-quadratic Gröbner basis, which we may assume reduced. The Chow ring is of finite rank, so the monomials  $D_S^k$ ,  $k \geq 1$ , cannot be all linearly independent, so for each  $S$ , either  $D_S$  or  $D_S^2$  appears as the leading monomial in our Gröbner basis. Let us consider the smallest variable  $D_S$  which does not appear as a leading monomial (i.e. the smallest variable that is not eliminated). This means that  $D_S^2$  appears as a leading monomial; moreover, since the Gröbner basis we consider is assumed reduced, this means that  $D_S^2$  is a relation. But our divisors always have nontrivial self-intersection for  $n \geq 4$ .

# Recollections: Etingof–Henriques–Kamnitzer–Rains–Singh presentation

Found independently by Etingof–Henriques–Kamnitzer–Rains to compute the modulo 2 cohomology of the *real*  $\overline{\mathcal{M}}_{0,1+n}$  in their Annals paper, and by Singh in his PhD thesis supervised by Strickland:

# Recollections: Etingof–Henriques–Kamnitzer–Rains–Singh presentation

Found independently by Etingof–Henriques–Kamnitzer–Rains to compute the modulo 2 cohomology of the *real*  $\overline{\mathcal{M}}_{0,1+n}$  in their Annals paper, and by Singh in his PhD thesis supervised by Strickland:

the generators are  $X_S$ ,  $S \subseteq \{1, 2, \dots, n\}$ ,  $|S| \geq 3$  and the relations between them are

- $X_S^2 = 0$  for  $|S| = 3$ ,
- $X_S(X_S - X_{S \setminus \{s\}}) = 0$  for  $|S| > 3$ , and  $s \in S$ ,
- $(X_{S \cup T} - X_S)(X_{S \cup T} - X_T) = 0$  for all  $S, T$  with  $S \cap T \neq \emptyset$ ,  $S \not\subseteq T$ ,  $T \not\subseteq S$ .

# Recollections: Etingof–Henriques–Kamnitzer–Rains–Singh presentation

Found independently by Etingof–Henriques–Kamnitzer–Rains to compute the modulo 2 cohomology of the *real*  $\overline{\mathcal{M}}_{0,1+n}$  in their Annals paper, and by Singh in his PhD thesis supervised by Strickland:

the generators are  $X_S$ ,  $S \subseteq \{1, 2, \dots, n\}$ ,  $|S| \geq 3$ , and the relations between them are

- $X_S^2 = 0$  for  $|S| = 3$ ,
- $X_S(X_S - X_{S \setminus \{s\}}) = 0$  for  $|S| > 3$ , and  $s \in S$ ,
- $(X_{S \cup T} - X_S)(X_{S \cup T} - X_T) = 0$  for all  $S, T$  with  $S \cap T \neq \emptyset$ ,  $S \not\subseteq T$ ,  $T \not\subseteq S$ .

( This is related to the De Concini–Procesi presentation by setting  $X_S := \sum_{S \subseteq T} Y_T$ .

## Statement of the main result

**Theorem.** There exist an ordering of monomials for which the Etingof–Henriques–Kamnitzer–Rains–Singh presentation has a quadratic Gröbner basis of relations. Consequently, the Chow ring of  $\overline{\mathcal{M}}_{0,1+n}$  is Koszul for all  $n$ .

## Statement of the main result

**Theorem.** There exist an ordering of monomials for which the Etingof–Henriques–Kamnitzer–Rains–Singh presentation has a quadratic Gröbner basis of relations. Consequently, the Chow ring of  $\overline{\mathcal{M}}_{0,1+n}$  is Koszul for all  $n$ .

*Choice of ordering.* Consider the following binary relation  $\prec'$  on the set  $2^{\{1,\dots,n\}}$ : we say that  $I \prec' J$  if either  $J = I \setminus \{a\}$  where  $a \in I$ ,  $a \neq \max(I)$ , or  $I = J \setminus \{\max(J)\}$ . Let  $\prec$  be the transitive closure of  $\prec'$ . Then  $\prec$  is a partial order. We extend it to a total order in ~~certain~~ <sup>any</sup> way, and use it to order the generators  $X_S$ ,  $S \subseteq \{1, 2, \dots, n\}$ ,  $|S| \geq 3$ . The associated graded lexicographic order of monomials is our order of choice.

## Statement of the main result

**Theorem.** There exist an ordering of monomials for which the Etingof–Henriques–Kamnitzer–Rains–Singh presentation has a quadratic Gröbner basis of relations. Consequently, the Chow ring of  $\overline{\mathcal{M}}_{0,1+n}$  is Koszul for all  $n$ .

*Choice of ordering.* Consider the following binary relation  $\prec'$  on the set  $2^{\{1,\dots,n\}}$ : we say that  $I \prec' J$  if either  $J = I \setminus \{a\}$  where  $a \in I$ ,  $a \neq \max(I)$ , or  $I = J \setminus \{\max(J)\}$ . Let  $\prec$  be the transitive closure of  $\prec'$ . Then  $\prec$  is a partial order. We extend it to a total order in certain way, and use it to order the generators  $X_S$ ,  $S \subseteq \{1, 2, \dots, n\}$ ,  $|S| \geq 3$ . The associated graded lexicographic order of monomials is our order of choice.

For example, for  $n = 4$ ,  $\{1, 2, 3\} \prec' \{1, 2, 3, 4\}$ , and  $\{1, 2, 3, 4\} \prec' S$  if  $|S| = 3$ ,  $S \neq \{1, 2, 3\}$ . One suitable extension is the lexicographic order of subsets (represented as ordered sequences):

$\{1, 2, 3\} < \{1, 2, 3, 4\} < \{1, 2, 4\} < \{1, 3, 4\} < \{2, 3, 4\}$ .

## Sketch of a proof, part 1 (technical)

There are some repetitions among the leading monomials.

Therefore, need to perform some Gaussian elimination: obtaining the following elements with pairwise different leading monomials.

## Sketch of a proof, part 1 (technical)

There are some repetitions among the leading monomials.

Therefore, need to perform some Gaussian elimination: obtaining the following elements with pairwise different leading monomials.

- $X_S^2, |S| = 3,$
- $X_S^2 - X_{\partial(S)}X_S, |S| > 3,$
- $X_{S \setminus \{s\}}X_S - X_S^2, |S| > 3, \max(S) \neq s \in S,$
- $(X_S - X_{S \cup T})(X_T - X_{S \cup T}), S \cap T \neq \emptyset, S \not\subseteq T, T \not\subseteq S,$   
 $\max(S) = \max(T),$
- $(X_S - X_{S \cup T})(X_T - U), S \cap T \neq \emptyset, S \not\subseteq T, T \not\subseteq S,$   
 $\max(S) > \max(T),$   $T$  not an initial interval of  $S \cup T$ ,  $U$  is the shortest initial interval of  $S \cup T$  containing  $T$ ,
- $(X_S - X_{S \cup T})(X_{\partial^{p-1}(S \cup T)} - X_{\partial^p(S \cup T)}), |(S \cup T) \setminus S| > 1,$   
 $p \geq 1, S \cap \partial^p(S \cup T) \neq \emptyset, S \not\subseteq \partial^p(S \cup T), \partial^p(S \cup T) \not\subseteq S,$
- $(X_S - X_{S \cup T})X_{\partial^p(S \cup T)}, |(S \cup T) \setminus S| = 1, p \geq 1,$   
 $S \cap \partial^p(S \cup T) \neq \emptyset, S \not\subseteq \partial^p(S \cup T), \partial^p(S \cup T) \not\subseteq S.$

Here  $\partial(S) = S \setminus \{\max(S)\}.$

## Sketch of a proof, part 2 (combinatorial)

Let us describe all quadratic monomials that are normal with respect to our modified set of relations, that is all quadratic monomials that do not occur among the leading terms of those relations. For that, we introduce a combinatorial notion.

## Sketch of a proof, part 2 (combinatorial)

Let us describe all quadratic monomials that are normal with respect to our modified set of relations, that is all quadratic monomials that do not occur among the leading terms of those relations. For that, we introduce a combinatorial notion.

Suppose that  $S$  and  $T$  are two proper subsets of  $\{1, \dots, n\}$  with  $|S|, |T| \geq 3$ . We shall say that  $T$  is an *MI-complement* (minimal interval complement) of  $S$  if the following conditions hold simultaneously:

- the intersection of  $S$  and  $T$  is not empty,
- $T$  is an initial interval of  $S \cup T$  (that is, if  $s \in S \cup T$  and  $s \leq \max(T)$ , then  $s \in T$ ),
- among all the initial intervals of  $S \cup T$  of cardinality at least three satisfying the above conditions,  $T$  is the shortest one.

We shall say that  $T$  is an *essential MI-complement* of  $S$  if it is an MI-complement of  $S$  and  $|T \setminus S| > 1$ .

## Sketch of a proof, part 2 (example)

Let  $n = 6$ .

## Sketch of a proof, part 2 (example)

Let  $n = 6$ .

The set  $T = \{1, 2, 3, 4, 5\}$  is an essential MI-complement of  $S = \{1, 4, 6\}$  because it is an initial interval of

$S \cup T = \{1, 2, 3, 4, 5, 6\}$ , and  $S \cup \partial(T) = \{1, 2, 3, 4, 6\} \neq S \cup T$ .

## Sketch of a proof, part 2 (example)

Let  $n = 6$ .

The set  $T = \{1, 2, 3, 4, 5\}$  is an essential MI-complement of  $S = \{1, 4, 6\}$  because it is an initial interval of  $S \cup T = \{1, 2, 3, 4, 5, 6\}$ , and  $S \cup \partial(T) = \{1, 2, 3, 4, 6\} \neq S \cup T$ .

On the contrary,  $T' = \{1, 2, 3, \cancel{4}\}$  is not an essential MI-complement of  $S$  even though  $T'$  is an initial interval of  $S \cup T' = \{1, 2, 3, 4, 6\}$ : the problem is that  $S \cup \partial(T') = \{1, 2, 3, 4, 6\} = S \cup T'$ , so there is a shorter initial interval that can be taken.

## Sketch of a proof, part 2 (example)

Let  $n = 6$ .

The set  $T = \{1, 2, 3, 4, 5\}$  is an essential MI-complement of  $S = \{1, 4, 6\}$  because it is an initial interval of  $S \cup T = \{1, 2, 3, 4, 5, 6\}$ , and  $S \cup \partial(T) = \{1, 2, 3, 4, 6\} \neq S \cup T$ .

On the contrary,  $T' = \{1, 2, 3, 4\}$  is not an essential MI-complement of  $S$  even though  $T'$  is an initial interval of  $S \cup T' = \{1, 2, 3, 4, 6\}$ : the problem is that  $S \cup \partial(T') = \{1, 2, 3, 4, 6\} = S \cup T'$ , so there is a shorter initial interval that can be taken.

The set  $T'' = \{1, 2, 4\}$  is an MI-complement of  $S$  because it is an initial interval of  $S \cup T'' = \{1, 2, 4, 6\}$ , and it is of length three, so there is nothing shorter; however, this MI-complement is not essential because  $T'' \setminus S = \{2\}$  is a set of cardinality one.

## Sketch of a proof, part 2 (example)

Let  $n = 6$ .

The set  $T = \{1, 2, 3, 4, 5\}$  is an essential MI-complement of  $S = \{1, 4, 6\}$  because it is an initial interval of  $S \cup T = \{1, 2, 3, 4, 5, 6\}$ , and  $S \cup \partial(T) = \{1, 2, 3, 4, 6\} \neq S \cup T$ .

On the contrary,  $T' = \{1, 2, 3, 4\}$  is not an essential MI-complement of  $S$  even though  $T'$  is an initial interval of  $S \cup T' = \{1, 2, 3, 4, 6\}$ : the problem is that  $S \cup \partial(T') = \{1, 2, 3, 4, 6\} = S \cup T'$ , so there is a shorter initial interval that can be taken.

The set  $T'' = \{1, 2, 4\}$  is an MI-complement of  $S$  because it is an initial interval of  $S \cup T'' = \{1, 2, 4, 6\}$ , and it is of length three, so there is nothing shorter; however, this MI-complement is not essential because  $T'' \setminus S = \{2\}$  is a set of cardinality one.

The set  $U = \{1, 2, 4\}$  is an essential MI-complement of each of the sets  $V' = \{1, 5, 6\}$ ,  $V'' = \{2, 5, 6\}$ , and  $V''' = \{4, 5, 6\}$ .

## Sketch of a proof, part 2 (combinatorial, continued)

**Lemma.** Suppose that  $S, T \subseteq \{1, \dots, n\}$  with  $|S|, |T| \geq 3$ . A commutative quadratic monomial  $X_S X_T$  is normal with respect to the modified set of generators if and only if  $\max(S) \neq \max(T)$  and one of the following three conditions hold:

- the subsets  $S$  and  $T$  are disjoint, 
- the subsets  $S$  and  $T$  are comparable, 
- one of them is an essential MI-complement of the other. 

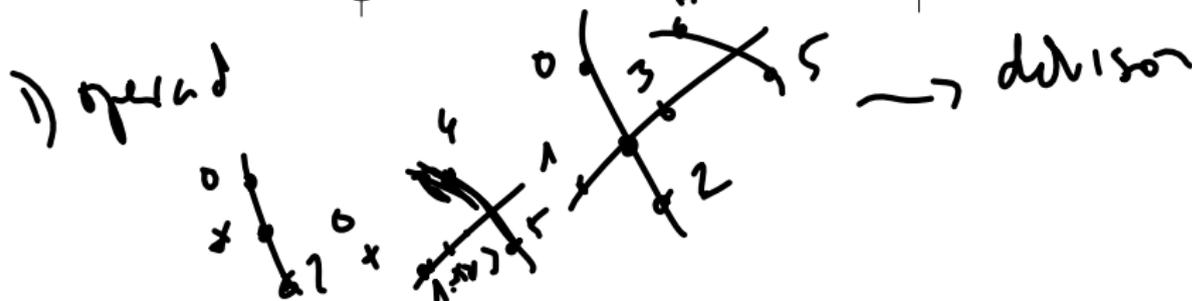

## Sketch of a proof, part 3 (the dual space)

On the dual level, if one considers the homology, there is an algebraic structure that assembles all the homology groups together: an operad.

## Sketch of a proof, part 3 (the dual space)

On the dual level, if one considers the homology, there is an algebraic structure that assembles all the homology groups together: an operad. In this case, one gets the operad `HyperCom` defined and studied by Getzler; it is generated by the fundamental classes  $\nu_k$  (one for each  $k \geq 2$ ) of homological degree  $2(k - 2)$ , satisfying the identities

$$\sum \begin{array}{c} a \quad b \quad \dots \\ \diagdown \quad \diagup \\ \circ \\ \diagup \quad \diagdown \\ \dots \quad \dots \\ \circ \\ \diagup \quad \diagdown \\ \dots \quad \dots \\ c \end{array} = \sum \begin{array}{c} a \quad c \quad \dots \\ \diagdown \quad \diagup \\ \circ \\ \diagup \quad \diagdown \\ \dots \quad \dots \\ \circ \\ \diagup \quad \diagdown \\ \dots \quad \dots \\ b \end{array} .$$

## Sketch of a proof, part 3 (the dual space)

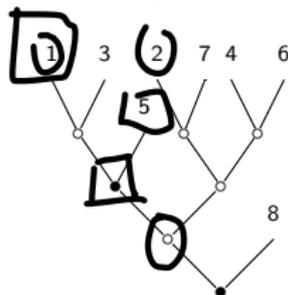

On the dual level, if one considers the homology, there is an algebraic structure that assembles all the homology groups together: an operad. In this case, one gets the operad `HyperCom` defined and studied by Getzler; it is generated by the fundamental classes  $\nu_k$  (one for each  $k \geq 2$ ) of homological degree  $2(k - 2)$ , satisfying the identities

$$\sum \text{Diagram 1} = \sum \text{Diagram 2} .$$

Using “shuffle operads” and Gröbner bases for operads (developed by myself and Khoroshkin in 2008), one obtains a basis `B` of the corresponding operad.

## Digression: shuffle tree monomials

This is a shuffle tree monomial for which the internal vertices of the underlying tree are labelled by two binary operations  $\{\circ, \bullet\}$ :

For each internal vertex, the minimal leaves of the subtrees growing at it increase from the left to the right.

## Sketch of a proof, part 3 (basis of the dual space)

A basis  $B$  of the homology operad may be defined inductively as follows:

## Sketch of a proof, part 3 (basis of the dual space)

$\mathcal{M}_{0,2}$

A basis  $B$  of the homology operad may be defined inductively as follows:

- the tree  without internal vertices belongs to  $B$ ,

- a shuffle tree monomial  belongs to  $B$  if and only

if  $\tau_1, \dots, \tau_k$  belong to  $B$ , and the root vertex of each of them but  $\tau_k$  has either just one input or at least three ones.

## Sketch of a proof, part 3 (basis of the dual space)

A basis  $B$  of the homology operad may be defined inductively as follows:

- the tree  $\begin{array}{c} \mathbf{1} \\ | \\ a \end{array}$  without internal vertices belongs to  $B$ ,

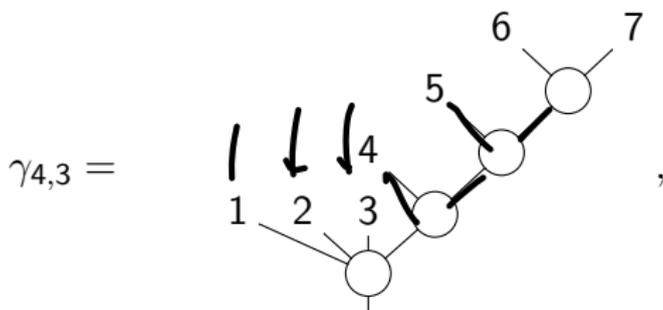

- a shuffle tree monomial  $\begin{array}{c} \tau_1 \quad \dots \quad \tau_k \\ \diagdown \quad | \quad \diagup \\ \bigcirc \\ | \end{array}$  belongs to  $B$  if and only

if  $\tau_1, \dots, \tau_k$  belong to  $B$ , and the root vertex of each of them but  $\tau_k$  has either just one input or at least three ones.

To build things inductively, we allow labels to come from any totally ordered set, not just  $\{1, \dots, n\}$ .

## Sketch of a proof, part 3 (basis of the dual space)

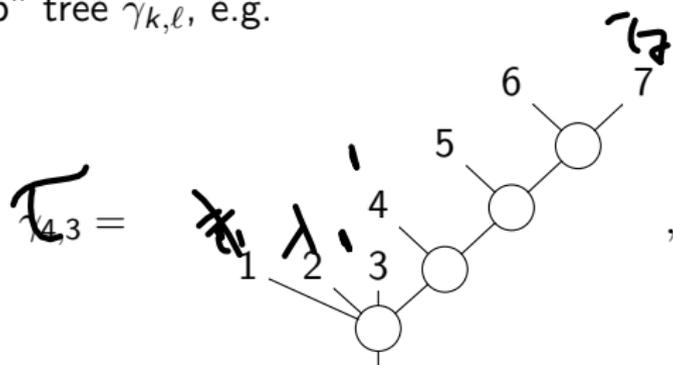

This can be expressed slightly less recursively as follows. One takes a “right comb” tree  $\gamma_{k,l}$ , e.g.

and grafts at its leaves certain elements of  $B$ , say  $\tau_1, \dots, \tau_k, \tau_{k+1}, \dots, \tau_{k+l}$ , each of which is either the trivial tree or a tree whose root vertex has strictly more than two children.

## Sketch of a proof, part 3 (basis of the dual space)

This can be expressed slightly less recursively as follows. One takes a “right comb” tree  $\gamma_{k,l}$ , e.g.

and grafts at its leaves certain elements of  $B$ , say  $\tau_1, \dots, \tau_k, \tau_{k+1}, \dots, \tau_{k+l}$ , each of which is either the trivial tree or a tree whose root vertex has strictly more than two children.

For such tree, we let

$S_p = \{a \in \text{Leaves}(\tau) : a \leq \min(\text{Leaves}(\tau_p))\}$ , and define

$$\Phi(\tau) = \Phi(\tau_1) \cdots \Phi(\tau_{k+l}) \prod_{j=3}^k X_{S_{j+l}}.$$

## Sketch of a proof, part 4 (surjection)

We shall show that  $\Phi$  is a surjection from the basis of the homology onto the set of all commutative monomials normal with respect to our quadratic relations.

## Sketch of a proof, part 4 (surjection)

We shall show that  $\Phi$  is a surjection from the basis of the homology onto the set of all commutative monomials normal with respect to our quadratic relations. The latter means that for each quadratic submonomial  $X_S X_T$ ,  $\max(S) \neq \max(T)$  and one of the following three conditions hold:

- the subsets  $S$  and  $T$  are disjoint,
- the subsets  $S$  and  $T$  are comparable,
- one of them is an essential MI-complement of the other.

## Sketch of a proof, part 4 (surjection)

We shall show that  $\Phi$  is a surjection from the basis of the homology onto the set of all commutative monomials normal with respect to our quadratic relations. The latter means that for each quadratic submonomial  $X_S X_T$ ,  $\max(S) \neq \max(T)$  and one of the following three conditions hold:

- the subsets  $S$  and  $T$  are disjoint,
- the subsets  $S$  and  $T$  are comparable,
- one of them is an essential MI-complement of the other.

First, we check that  $\Phi$  constructs normal monomials. Second, we construct a right inverse  $\Psi$ , inductively. Essentially, either a normal monomial is a product of several ones for disjoint sets, or it is divisible by  $X_{\{1, \dots, n\}}$ , or it has a unique divisor  $X_S$  with  $n \in S$ , and  $S \neq \{1, \dots, n\}$ , depending on this, we construct an inductive description.

## Sketch of a proof, conclusion

Existence of right inverse implies surjectivity of  $\Phi$ , so the ranks of cohomology groups of  $\overline{\mathcal{M}}_{0,1+n}$  are estimated from the above by the ranks of homology groups.

## Sketch of a proof, conclusion

Existence of right inverse implies surjectivity of  $\Phi$ , so the ranks of cohomology groups of  $\overline{\mathcal{M}}_{0,1+n}$  are estimated from the above by the ranks of homology groups.

Of course, we know that they are equal, so the estimate itself is not a big deal: what is a big deal is that the estimate is sharp if and only if our quadratic relations form a Gröbner basis, completing the proof.

## Application

According to the theory of Koszul spaces (Berglund 2014), for a formal space whose rational cohomology algebra is Koszul, the Koszul dual algebra is isomorphic  $H_*(\Omega X, \mathbb{Q})$  with the Pontryagin product, and the latter, thanks to Milnor–Moore, is the universal envelope  $U(\pi_*(\underline{\underline{\Omega \overline{\mathcal{M}}_{0,1+n}}}) \otimes \mathbb{Q})$ .

$$\pi_1(X) = 0$$

## Application

According to the theory of Koszul spaces (Berglund 2014), for a formal space whose rational cohomology algebra is Koszul, the Koszul dual algebra is isomorphic  $H_{\bullet}(\Omega X, \mathbb{Q})$  with the Pontryagin product, and the latter, thanks to Milnor–Moore, is the universal envelope  $U(\pi_*(\overline{\Omega \mathcal{M}}_{0,1+n}) \otimes \mathbb{Q})$ .

As a consequence, we can compute the rational homotopy Lie algebras of our spaces.

## Application

According to the theory of Koszul spaces (Berglund 2014), for a formal space whose rational cohomology algebra is Koszul, the Koszul dual algebra is isomorphic  $H_\bullet(\Omega X, \mathbb{Q})$  with the Pontryagin product, and the latter, thanks to Milnor–Moore, is the universal envelope  $U(\pi_*(\overline{\Omega\mathcal{M}}_{0,1+n}) \otimes \mathbb{Q})$ .

As a consequence, we can compute the rational homotopy Lie algebras of our spaces.

**Theorem.** The rational homotopy Lie algebra  $\pi_*(\overline{\Omega\mathcal{M}}_{0,1+n}) \otimes \mathbb{Q}$  is isomorphic to the graded Lie algebra generated by odd elements  $Y_S$ , where  $S \subseteq \{1, \dots, n\}$ ,  $|S| \geq 3$ , subject to relations

$$[Y_S, Y_T] = 0, \quad \text{for } S \text{ and } T \text{ with } S \cap T = \emptyset,$$

$$\sum_{\substack{\{T_1, T_2\} \subset 2^S: \\ T_1 \cap T_2 \neq \emptyset, T_1 \cup T_2 = S}} [Y_{T_1}, Y_{T_2}] = 0, \quad \text{for } |S| > 3,$$

$$\left[ Y_T, \sum_{T \cup K = S} Y_K \right] = 0, \quad \text{for } S \text{ and } T \text{ with } T \subset S, |S \setminus T| > 1.$$

## Further results

A simple long overlooked observation:

## Further results

A simple long overlooked observation:

**Theorem.** The cohomology ring  $H^*(X_\Sigma, \mathbb{Q})$  of a complex smooth projective toric variety  $X_\Sigma$  is Koszul if and only if it is quadratic.

## Further results

A simple long overlooked observation:

**Theorem.** The cohomology ring  $H^*(X_\Sigma, \mathbb{Q})$  of a complex smooth projective toric variety  $X_\Sigma$  is Koszul if and only if it is quadratic.

This includes the so called Losev–Manin spaces, and the noncommutative generalisations of  $\overline{\mathcal{M}}_{0,1+n}$  which are toric varieties of the Stasheff polytopes.

## Further results

A simple long overlooked observation:

**Theorem.** The cohomology ring  $H^*(X_\Sigma, \mathbb{Q})$  of a complex smooth projective toric variety  $X_\Sigma$  is Koszul if and only if it is quadratic.

This includes the so called Losev–Manin spaces, and the noncommutative generalisations of  $\overline{\mathcal{M}}_{0,1+n}$  which are toric varieties of the Stasheff polytopes.

**Conjecture.** Consider a hyperplane arrangement in  $\mathbb{P}(V)$ . Let  $\mathcal{G}$  be a building set of its intersection lattice, and let  $\overline{Y}_{\mathcal{G}}$  be the De Concini–Procesi projective wonderful model associated to the building set  $\mathcal{G}$ . The ring  $H^*(\overline{Y}_{\mathcal{G}}, \mathbb{Z})$  is Koszul if and only if it is quadratic.

The ring  $H^\bullet(\overline{Y}_{\mathcal{G}}, \mathbb{Z})$  is Koszul if and only if it is quadratic.

Another conjecture I made (including the case of the maximal building set in the conjecture above) has already become a theorem.
